This example uses a multi record editor called test3 that contains 2 upload fields, "pdf" and "image"

The code on the PHP viewer page to display the image as an active link is below.

The basic structure of the code you want to appear in the client's browser is.

```
<a href="path to your pdf upload"> any other text that you want under the image</a>
```

It's also a good idea to put a link on your page that lets the visitor know that they'll need at least the free Adobe PDF reader to open the PDF document. The link to the free reader is: <http://get.adobe.com/reader/>

In the PHP code to accomplish this there is one main foreach loop that says look at each record in the test3 table. This loop is closed with an endforeach at the end of the code block.

Then there's a nested foreach loop for the pdf uploads that says look for the pdf upload path in each of the test3 records and display the path. This loop is closed at the end of the pdf code.

There's a 3rd nested foreach loop to look for image uploads and display them as images. This loop is closed at the end of the image display code.

These loops are extracted from the full code in the CMS Admin code generator. As long as you know what type of uploads you're working with, you don't have to use all of the "if" tests in the code. This makes your page much cleaner and easier to understand.

```
<?php foreach ($test3Records as $record): ?>
<?php foreach ($record['pdf'] as $upload): ?>
<a href="<?php echo $upload['urlPath'] ?>"> <?php endforeach ?>

<?php foreach ($record['image'] as $upload): ?>

" height="<?php echo $upload['thumbHeight'] ?>" alt="" />Click On the Image for the PDF</a>
<?php endforeach ?><?php endforeach ?>
```
